In psychometrics, item response theory is a paradigm for the design, analysis, and scoring of tests, questionnaires, and similar instruments measuring abilities, attitudes, or other variables. It is a theory of testing based on the relationship between individuals' performances on a test item and the test takers' levels of performance on an overall measure of the ability that item was designed to measure. Several different statistical models are used to represent both item and test taker charact

The third assumption of the item response theory is local independence. In other words, to use these models, the items must be independent of each other. Thus, the answers to one item can't affect the response to other items. Thus, if the unidimensionality is met, local independence is also fulfilled.
