Ngn Architectures Protocols And Services

This book focuses on Next Generation Networks (NGN); in particular, on NGN architectures, protocols and services, including technologies, regulation and business aspects. NGN provides convergence between the traditional telecommunications and the Internet, and it is globally standardized by the ITU (International Telecommunication Union), where ITU is the United Nations specialized agency for Information and Communication Technologies - ICTs.

A number of control plane protocols are allowed by the NGN architecture. The control plane protocols depend on whether the connectionless or connection-oriented categories of the NGN are to be implemented. This section considers both routing and signaling protocols for connectionless categories of NGN as shown in Figure 1.

The next-generation network is a body of key architectural changes in telecommunication core and access networks. The general idea behind the NGN is that one network transports all information and services by encapsulating these into IP packets, similar to those used on the Internet. NGNs are commonly built around the Internet Protocol, and therefore the term all IP is also sometimes used to describe the transformation of formerly telephone-centric networks toward NGN. NGN is a different concept
